- Sedimentary to Metamorphic:

Sedimentary rocks buried deep in the crust experience high pressure and temperature, transforming into metamorphic rocks.

- Metamorphic back to Igneous:

Metamorphic rocks can melt under extreme conditions, forming magma that cools to produce new igneous rocks.

This cyclic process underscores the dynamic and ever-changing nature of Earth's crust.

Mineralogical Composition and Texture

The mineral content and texture of rocks are critical for classification and understanding their properties.

Mineralogical Composition:

- Determines physical properties such as hardness, cleavage, and color.
- Provides clues about the environment of formation.

Texture:

- Refers to the size, shape, and arrangement of mineral grains.
- Texture influences a rock?s durability, appearance, and suitability for various uses.

Common textures include:

- Phaneritic: Coarse-grained, visible crystals.
- Aphanitic: Fine-grained, crystals too small to see.
- Foliated: Layered or banded appearance (metamorphic).
- Non-foliated: Random mineral distribution (metamorphic).
